String Formatting

Types of String Formatting

1)Formatting with string literals call f-string

To create an f string prefix the string with the letter "f"

In [17]:
```
a=10
b=20
add=a+b
print("Addition of a and b is :",add)
```

```
Addition of a and b is : 30
```

In [18]:
```
a=10
b=20
add=a+b
print(f"Addition of {a} and {b} is {add}")
```

```
Addition of 10 and 20 id 30
```

2)Formatting with format method

In [19]:
```
a=10
b=20
add=a+b
print("Addition of {} and {} is :{}".format(a,b,add))
```

```
Addition of 10 and 20 is :30
```

In [20]:
```
a=10
b=20
add=a+b
print("Addition of {} and {} is :{}".format(b,a,add))
```

```
Addition of 20 and 10 is :30
```

3)Foramtting with % operator

In [21]:
```
a=40
b=3
add=a+b
print("Addition of %d and %d is :%d"%(a,b,add))
```

```
Addition of 40 and 3 is :43
```

In [22]:
```
a=40
b=3.14
add=a+b
print("Addition of %d and %f is:%f"%(a,b,add))
```

```
Addition of 40 and 3.140000 is:43.140000
```

In [30]:
```
a=20
b=40.34567
add=a+b
print(f"Addition of {a} and {b} is : {add}")
print("Addition of {} and {} is :{}".format(a,b,add))
print("Addion of {1} and {0} is :{2}".format(a,b,add))
print("Addition of %d and %.2f is: %.3f"%(a,b,add))
```

```
Addition of 20 and 40.34567 is : 60.34567
Addition of 20 and 40.34567 is :60.34567
Addion of 40.34567 and 20 is :60.34567
Addition of 20 and 40.35 is: 60.346
```

What is input?

In [ ]:
```
Input means providing data to the computer.
```

Syntax:

In [ ]:
```
input()
```

In [31]:
```
name=input("Enter your name:-")
print(name)
```

```
Enter your name:- Bhagyashri

Bhagyashri
```

In [32]:
```
city=input("Enter your city name:-")
print(city)
```

```
Enter your city name:- Shrirampur

Shrirampur
```

In [ ]:
```
Input method always taking string as a input
```

In [34]:
```
age=input("Enter your age:")
print(type(age))
```

```
Enter your age: 18

<class 'str'>
```

In [35]:
```
age=int(input("Enter your age:-"))
print(type(age))
```

```
Enter your age:- 23

<class 'int'>
```

In [37]:
```
height=float(input("Enter height:-"))
print(height)
print(type(height))
```

```
Enter height:- 23.5

23.5
<class 'float'>
```

Student Registration Form

In [39]:
```
name=input("Enter name:")
age=int(input("Enter age:"))
city=input("Enter city:")
course=input("Enter Course:")
print("----------------------------")
print(f"Name:{name}")
print(f"Age:{age}")
print(f"City:{city}")
print(f"Course:{course}")
```

```
Enter name: Bhagyashri
Enter age: 30
Enter city: Shrirampur
Enter Course: Data Science and Gen AI

----------------------------
Name:Bhagyashri
Age:30
City:Shrirampur
Course:Data Science and Gen AI
```

In [ ]:
```

```

Interview questions:

What is the purpose of input()?

In [ ]:
```
It is used to take input from the user
```

what is the return type of input()

In [ ]:
```
string
```

why do we use int(input())?

In [ ]:
```
to convert user input into integer
```

In [40]:
```
str=input("Enter First name and Middle Name and last name")
print(str)
```

```
Enter First name and Middle Name and last name Bhagyashri Arjun Akolkar

Bhagyashri Arjun Akolkar
```

In [41]:
```
str1=input("Enter Name and Age")
print(str1)
print(type(str1))
```

```
Enter Name and Age Bhagyashri 30

Bhagyashri 30
<class 'str'>
```

In [ ]:
```

```
