

String Functions

15)Join()

In []: It **is** used to convert **list** to string by defined delimiter i.e (" ")
Syntax: `"substring".join(list1)`

In [1]: `list1=["Machine","learning","and","deep","learning"]`
`" ".join(list1)`

Out[1]: 'Machine learning and deep learning'

In [2]: `list1=["Machine","learning","and","deep","learning"]`
`'-'.join(list1)`

Out[2]: 'Machine-learning-and-deep-learning'

In [3]: `list1=["Machine","learning","and","deep","learning"]`
`'--'.join(list1)`

Out[3]: 'Machine--learning--and--deep--learning'

16)endswith()

In []: It **return** true **if** string end **with** substring.

In [5]: `str1="Machine learning"`
`str1.endswith('g')`

Out[5]: True

In [6]: `str1="Machine learning"`
`str1.endswith('n')`

Out[6]: False

In [7]: `str1="Machine learning$"`
`str1.endswith('$')`

Out[7]: True

In [12]: `imagepath="C:\\Users\\Sai\\Pictures\\abhu.png"`
`imagepath`

Out[12]: 'C:\\Users\\Sai\\Pictures\\abhu.png'

```
In [10]: imagepath.endswith(".png")
```

```
Out[10]: True
```

17)startswith()

```
In [ ]: iIt return true if string start with substring.
```

```
In [13]: string1="Data sceince"  
string1.startswith("D")
```

```
Out[13]: True
```

```
In [14]: string1="Data sceince"  
string1.startswith("d")
```

```
Out[14]: False
```

```
In [15]: str1="python and data science and machine learning"  
str1.startswith('python')
```

```
Out[15]: True
```

18)isalnum

```
In [ ]: isalnum>>Is alpha numeric  
AlplaNumeric >a-z,A-Z,0-9  
True or False  
  
Space is not allowed
```

```
In [16]: string='python'  
string.isalnum()
```

```
Out[16]: True
```

```
In [17]: str1='12345python'  
str1.isalnum()
```

```
Out[17]: True
```

```
In [18]: str2='1234.python'  
str2.isalnum()
```

```
Out[18]: False
```

19)isalpha()

```
In [ ]: a-z,A-Z
True or False result ytp
Space is not allowed.
```

```
In [19]: str1='python'
str1.isalpha()
```

Out[19]: True

```
In [20]: str1="PYTHON"
str1.isalpha()
```

Out[20]: True

```
In [21]: str1="PYTHON123"
str1.isalpha()
```

Out[21]: False

20)isdecimal()

```
In [ ]: 0-9, and Unicodes of (0-9)
space is not allowed.
```

```
In [22]: num='123456789'
num.isdecimal()
```

Out[22]: True

```
In [23]: num1='12341a'
num1.isdecimal()
```

Out[23]: False

```
In [25]: adhar_num="3456 8907 7890"
adhar_num.isdecimal()
```

Out[25]: False

```
In [24]: adhar_num="3456 8907 7890"
adhar_num=adhar_num.replace(" ","")
adhar_num.isdecimal()
```

Out[24]: True

```
In [26]: string='\u0030' #unicode for 0
string.isdecimal()
```

Out[26]: True

```
In [27]: string='\u0031'  #unicode for 1
string.isdecimal()
```

Out[27]: True

```
In [28]: string='\u0039'  #unicode for 9
string.isdecimal()
```

Out[28]: True

```
In [29]: string='\u0040'  #unicode for 0
string.isdecimal()
```

Out[29]: False

```
In [30]: string='\u0029'  #unicode for 0
string.isdecimal()
```

Out[30]: False

21)isdigit()

In []: 0-9 and unicodes of 0-9 ,subscripts and superscripts

```
In [49]: string="\u00B2"  #superscripts for power 2
string.isdigit()
```

Out[49]: False

22)isnumeric()

In []: 0-9 and unicodes of 0-9 ,subscripts and superscripts
space is not allowed ,
Vulgar fraction

In []: U+00BD>>1/2

```
In [32]: string="\u00BD"
string.isnumeric()
```

Out[32]: True

```
In [33]: string="\u00BD"
string.isdigit()
```

Out[33]: False

23)isupper()

```
In [ ]: True if string is in uppercase, otherwise False.  
Space is allowed
```

```
In [34]: string="PYTHON"  
string.isupper()
```

Out[34]: True

```
In [36]: string="python"  
string.isupper()
```

Out[36]: False

24)islower()

```
In [ ]: True if string is in lowercase ,otherwise Return False  
Space is allowed.
```

```
In [38]: str1='data science'  
str1.lower()
```

Out[38]: 'data science'

```
In [39]: str1.islower()
```

Out[39]: True

```
In [40]: string="Rohit sharma"  
string.islower()
```

Out[40]: False

```
In [46]: string4="rohit sharma"  
string4.lower()
```

Out[46]: 'rohit sharma'

```
In [47]: string4.islower()
```

Out[47]: True

```
In [48]: str2="machine learning"  
str2.islower()
```

Out[48]: True

25)istitle()

```
In [ ]: True if string is in titlecase , otherwise false
```

```
string.istitle()  
space is allowed.
```

```
In [52]: str1="Virat Kohli"  
str1.istitle()
```

Out[52]: True

```
In [53]: str1="Virat kohli"  
str1.istitle()
```

Out[53]: False

```
In [54]: str1="          Virat Kohli"  
str1.istitle()
```

Out[54]: True

26)isspace()

```
In [ ]: If string only contained space then True  
Result type is True or False
```

```
In [55]: s1="          "  
s1.isspace()
```

Out[55]: True

```
In [56]: str1="          z"  
str1.isspace()
```

Out[56]: False

27)zfill()

zero filling in result

```
In [58]: string='4567'  
string.zfill(8)
```

Out[58]: '00004567'

```
In [ ]: 1)capitalize()
        2)upper()
        3)lower()
        4)casefold()
        5)title()
        6)lstrip()
        7)rstrip()
        8)strip()
        9)swapcase()
        10)replace()
        11)count()
        12)index()
        13)find()
        14)split()
        15)join()
        16)endswith()
        17)startswith()

        18)isalnum()
        19)isalpha()
        20)isdecimal
        21)isdigit()
        22)isnumeric()

        23)islower()
        24)isupper()
        25)istitle()
        26)isspace()

        27)zfill()
```
